## REQUEST FOR NOMINATIONS FOR DIRECTOR Board of Directors Election 2024

7 A call for nominations for the office of Director of the Saskatchewan Milk Marketing Board has been made this week.

Two directors have reached the end of their term this year. Two (2) positions on the Board of Directors are eligible for this election in 2024.
Each position is a three-year term appointment. These positions will commence at the 2024 SaskMilk AGM on November 19, 2024. An

additional (eighth) position on the SaskMilk Board will remain vacant for

 $\dots 12$  the next year.

... 1 6 Please check your email or log-in to the SaskMilk portal for further information and to obtain a nomination form.

## FCC Sustainability Incentive Program

FCC's sustainability incentive programs reward farmers who are successfully adopting environmental best management practices and encourage continued sustainable farming by granting annual incentives of up to \$2,000 to FCC customers who meet select criteria.

Dairy farmers who meet a combination of herd sustainability metrics and proAction® Environment module results may qualify. Furthermore, successful applicants could be eligible for additional incentives sponsored by Starbucks Canada in the categories of Top Achieving and Most Improved.

For more information including how to apply please visit:

fcc.ca/sustainabilityprograms.

## **SAVE THE DATE!**

2024 Sask Dairy Conference &
15th Annual General Meeting

November 19 & 20, 2024

Saskatoon Inn and Conference Centre, Saskatoon

# **RAYNER DAIRY REPORT**

## Research activity at the Rayner Dairy Research and Teaching Facility

**Greg Penner** 

At the University of Saskatchewan, we are very fortunate to have support from Saskatchewan Dairy Farmers through SaskMilk for research, teaching, and outreach activity at the Rayner Dairy Research and Teaching Facility. The research activity has been quite intense over the past year and this article summarizes the studies that have been conducted, are underway, and are planned.

#### Recently completed studies

A new method to measure the gastrointestinal tract leakiness in dairy cattle. Many feed additives are reported to improve (gastrointestinal tract) gut health, but proving a positive effect on gut health is very challenging. In this study, we developed and evaluated a new method to evaluate the leakiness of the rumen and intestinal regions. We have shown that this method is sensitive and have found that the intestinal regions contribute most to the leakiness of the gut for dairy cattle. This study provides a new technique that can be used by researchers and companies to evaluate the efficacy of feed additives designed to improve gut health. This research was completed by Claire Bertens under the supervision of Dr. Penner. The research was supported by the Natural Sciences and Engineering Research Council and SaskMilk.

Evaluation of processing methods and severity for barley grain. There has been a shift in how barley grain is processed for dairy cattle with much more use of grinding rather than rolling. Past research clearly showed that increasing the severity of barley grain processing increased risk for ruminal acidosis and did not always improve performance responses. However, diet formulation strategies have also changed, and conventional diets tend to have quite a bit less starch than when those original studies were conducted. In this study we compared ground barley, dry rolled barley, and two reconstituted high-moisture barley treatments. The ground barley was obviously processed more severely than any of the other treatments and had 34% of the particles that passed through a 1.18 mm sieve. The dry rolled and coarsely processed reconstituted high moisture barley were processed to a similar severity. The final treatment was a more finely processed reconstituted high moisture barley. The preliminary results suggest that barley grain processing method has no impact on feed intake, milk or milk component yield, and rumen fermentation. These results suggest that method and severity of processing for barley grain does not affect

production responses. This study was completed by Bev Lynch under supervision of Dr. Penner and was funded by SaskBarley, SaskMilk, and the National Sciences and Engineering Research Council of Canada.

Can we help accelerate recovery from mastitis? Mastitis cases have been estimated to cost over \$650/case due to long term milk yield loss, discarded milk, cow removal from the herd, antimicrobial use, and added labour costs. With mastitis, cows also drop feed intake which may increase risk for gastrointestinal disorders once they start to feel better. In this study, we used a model to induce mammary inflammation rather than infecting cows with a mastitis pathogen. We investigated whether the use of pre- and probiotic could help reduce the response to the simulated mastitis challenge and whether it could accelerate cow recovery. We also evaluated the impact of mammary inflammation and risk for gastrointestinal disorders during recovery. The cow-research component for this study is complete and we are working on the sample and data analysis. This research was completed by Claire Bertens under the supervision of Dr. Penner. The research was funded by Papillon Agriculture Company, SaskMilk, and an application to the National Sciences and Engineering Research Council of Canada is underway.

#### **Ongoing Studies**

Evaluation of hybrid rye as a silage source for lactating dairy cattle. Winter cereals provide an opportunity to diversify cropping and alter timing of silage production. In addition, new varieties of rye have been introduced in Canada and these are reported to have greater yield than conventional rye along with reduced ergot risk. There are no data available for the impacts of hybrid rye use in diets for lactating dairy cattle. This study will evaluate the use of hybrid rye as a substitute for barley silage. The hybrid rye was harvested at the boot stage and when incorporating hybrid rye into the diet we ensured that dietary starch was not affected. Increasing hybrid rye inclusion, on paper, should provide a diet with greater digestible fibre. This study is currently underway and is being conducted by Bianca Rusawo under the supervision of Dr. Mutsvangwa. Funding for this project has been provided by KWS Seeds Canada Inc., SaskMilk, and the Natural Sciences and Engineering Research Council of Canada.

Evaluating polycrop silage as a partial replacement for barley silage. The use of diverse cropping strategies has been a growing trend both locally and internationally. There are many approaches being used with plant species selected to balance soil nutrient and horizon use, have differing preference for growing conditions, and to provide a more diverse nutritional profile for the forage. Some of these also use biennials allowing a single seeding event to provide forage that summer, cover of the soil outside of active growing seasons, and a forage the following year without a new seeding event. In this study, we are evaluating a biennial forage blend that primarily consists of sweet clover, hairy vetch, and winter triticale as a replacement for barley silage. This study was just initiated and is being conducted by Ingrid Nyazika under the supervision of Dr. Penner. This research has been funded by SaskMilk, Imperial Seeds, the Beef Cattle Research Council of Canada, and the Natural Sciences and Engineering Research Council of Canada.

Evaluating the economic impact of the ProAction tagging requirement for beef × dairy calves. As I am sure you know, calves born on dairy farms must be tagged with a DairyTrace tag to meet the traceability requirements for ProAction. Producers in Saskatchewan raised a concern over potential impacts of this requirement for beef × dairy calves. In response, we collaboratively designed a research project to evaluate whether calves tagged with the DairyTrace tag receive a different price than calves tagged with the CCIA tag (yellow beef tag). This study is set to start very soon and communication for producer recruitment will be forthcoming. This research is being led by Rebecca Zanello under the supervision of Dr. Eric Micheels in the Department of Agricultural Resource Economics in the College of Agriculture and Bioresources at the University of Saskatchewan. This research has been collectively funded by the Western Milk Pool and MITACS.

#### In-vivo harvesting of bovine endometrial epithelial cells for 2-D and 3-D cell culture.

This project involves collecting cells lining the uterine surface from postpartum cows using a modified artificial insemination assembly. The collected cells are assessed for viability, culture characteristics, and phenotype. These cells will be utilized to create lab-on-chip models for developing diagnostic tests for uterine inflammation and conducting challenge studies for the discovery of antimicrobial peptides. This research is conducted by Mitzi Vink (visiting graduate student) and Sai Kimar under the supervision of Dr. Dinesh Dadarwal in the Western College of Veterinary Medicine. Funding for this project has been provided by SaskMilk, Boehringer Ingelheim, and the Natural Sciences and Engineering Research Council of Canada.

Impact of metabolic and immune status on the uterine microenvironment of postpartum dairy cows. The objective of this study is to characterize the associations between peripheral blood and liver metabolic status and immune cell functions of dairy cows during the transition period and their impact on the uterine inflammatory state and microbial population. This study will help us identify predictors of uterine inflammation and its resolution. Additionally, we aim to discover potential probiotic bacteria to be used later in clinical trials for the prevention and treatment of uterine inflammation, ultimately improving reproductive performance in dairy cows. This research is conducted by Sai Kumar under the supervision of Dr. Dinesh Dadarwal in the Western College of Veterinary Medicine. Funding for this project has been provided by SaskMilk and the Natural Sciences and Engineering Research Council of Canada.

#### **Upcoming Studies**

Use of a blended fat-stimulating feed products on rumen parameters and milk fat in dairy cows. The development of value-added blended fat-stimulating feed products (BFSFP) has been initiated to increase milk yield and milk fat in lactating dairy cows. This new feed product (BFSFP) is a complex combination of local ingredients, including a triple-fermented protein source (wheat-dried distillers' grains), low-processed soluble fibre and rumen buffers. The BFSFP has been evaluated and compared with commercial protein

feeds for energy values using laboratory-based tests including incubating the feeds in the rumen of dairy cattle and in the lab using in vitro fermentation studies. This study will evaluate the replacement of commercial protein feeds with BFSFP on feed intake, milk and milk component yield, and income over feed costs for lactating dairy cattle. This study will be conducted by Umair Ihsan under the supervision of Dr. Peiqiang Yu. Funding for this research has been provided by SaskMilk, Alberta Milk, and the Saskatchewan Agriculture Development Fund.

Evaluating blended pellet products to mitigate methane and optimize nutrient supply in ruminants. Plant extracts and their secondary metabolites have been identified as a promising alternative to mitigate enteric methane production. This study evaluated newly developed blended pellets containing co-products from the pulse and bio-oil processing industries and plant extracts to determine the effects on rumen fermentation characteristics in dairy cows. Canola meal (CM) and pea screenings (PS) at two ratios (50:50 and 70:30 CM and PS, respectively) were mixed with different concentrations of hydrolysable tannins, saponins, and a combination of both products and processed into pellets at the Canadian Feed Research Centre (CFRC, North Battleford, SK). This study is scheduled to start in the near future. The research will be completed by Taufiq Hidayat under the supervision of Dr. Peiqiang Yu. This research was funded by SaskMilk and the Saskatchewan Agriculture Development Fund.

**Evaluation of processing methods and severity for barley grain.** As noted in the recently completed research, we have found that processing method has little impact on productivity of lactating dairy cows. We suspect this may be related to the dietary starch concentration. This study will test the impact of processing method and dietary starch concentration on feed intake, ruminal fermentation, and milk and milk component yields for lactating dairy cattle. This project will be conducted by Takudzwa Gondo under the supervision of Dr. Penner. Funding for this project is from SaskBarley, SaskMilk, and the National Sciences and Engineering Research Council of Canada.

Evaluating the bioavailability of a new rumen protected choline product. Bypass choline has been a staple additive in diets for close-up cows and, when possible, in early lactation. These products release choline in the intestine through the use of a protective coating. However, the type of coating can have a major impact on the availability and the part of the gastrointestinal tract where they are released. A new bypass choline product is on the market and data is needed to assess its bioavailability and to generate sufficient data so that it can be licenced for use in Canada. Casey Bradford will complete this study which has been funded by Kemin and SaskMilk.

Impact of partial mixed ration (PMR) management and pellet feeding rates in automated milking systems (AMS). Our past research at the Rayner has shown that management of the PMR has a major impact on the success of feeding programs in barns with AMS. We suspect that the AMS pellet feeding approach will have a stronger impact when cows are fed PMR to target lower quantities of refusal. This study will evaluate the interaction of PMR feeding level (targeting 2 quantities of refusal) and the pellet feeding

rate in the AMS on feed intake, voluntary attendance at the AMS, milk and milk component yields, and income over feed cost. This study will be conducted by Sophia Donde under the supervision of Dr. Penner and has been supported by the Gustaf de Laval Fund for Young Scientists, SaskMilk, and a funding request to the Natural Sciences and Engineering Research Council of Canada.

Does the protein content of the pellet in the AMS affect substitution of the PMR? When the amount of pellet in the AMS is increased, PMR intake decreases. The magnitude of reduction for PMR intake may be affected by the composition of the pellet. In this study we will evaluate how pellet protein concentration and AMS pellet allocation influence PMR and AMS pellet intake, voluntary attendance at the AMS, milk and milk component yields, and income over feed cost. This study will be conducted by Sophia Donde under the supervision of Dr. Penner and has been funded by Results Driven Agriculture Research (RDAR) and SaskMilk.

**Evaluating the use of an individualized lactation length.** Milk production and the persistency of production for dairy cattle has increased tremendously leading to some cows having very high milk yield at dry off. However, it is currently not possible to select which cows will have high milk yield at dry off and standard voluntary waiting times are implemented before breeding thereby dictating the length of the lactation. This study will use a modelling approach to evaluate the optimal lactation length for each cow and will apply a traditional (305 d) or individualized lactation length. This project is led by Dr. Mutsvangwa and has been funded by Dairy Farmers of Canada and the Agri-Science program administered through the Government of Canada (Ottawa, ON, Canada).

As you can see, the Rayner Dairy Research and Teaching Facility is well occupied, and we hope the projects and results will positively contribute to the profitability for dairy producers in Saskatchewan and Western Canada as a whole. We are looking forward to sharing results of these projects at the upcoming SaskMilk Dairy Info Day (February 11, 2025). These projects also provide high-quality training opportunities for undergraduate and graduate students. One other important note is that core funding provided by SaskMilk is strongly leveraged to extend the research support making efficient use of producer-driven support.

More information on the research can be obtained by email at greg.penner@usask.ca

## **DFC Update**

Canadian dairy an integral part of a more sustainable value chain says
Starbucks Canada

Sustainability was on the menu at Dairy Farmers of Canada's (DFC) 2024 Annual General Meeting in St. John's, Newfoundland and Labrador. Presenting to attendees were Starbucks Canada's supply chain manager, Juliana de van der Schueren, and the head of social impact, public policy and sustainability, Ross Anderson. They spoke about how operating directly with the dairy sector increases agricultural resiliency in light of climate change.

They highlighted the necessity of working with farmer organizations to collaborate to create a more sustainable supply chain, from the coffee farms supplying beans to the dairy farms across Canada producing the milk that goes into Starbucks' drinks.

"We have to recognize that farms are unique in the circumstances that they have, and not 'one size fits all'," said Anderson. "We want to collaborate with farms and the farming industry to figure out what's right for them."

de van der Schueren detailed the programs Starbucks has helped fund in their Canada-unique approach: Benchmarking and On-Farm Greenhouse Gas Assessment Pilot programs begun by DFC, and Farmer Recognition funding with Farm Credit Canada (FCC), the latter of which is already underway.

This program rewards farmers who are successfully adopting environmental best management practices and encourages continued sustainable farming by granting annual incentives of up to \$2,000 to FCC customers who meet select criteria. As part of the partnership with DFC and overall investment for the year, Starbucks will provide additional funding to the FCC program in two new categories, Top Achieving and Most Improved, further recognizing the sustainability successes of Canadian dairy farmers.

When it came to contributing funding for the three initiatives, according to de van der Schueren, the dairy industry's progress made it a seamless fit. "The work was already happening by Dairy Farmers of Canada," she said. "We were able to come in and continue on that journey and support the work they are already doing because of our shared sustainability visions."

"We are taking the time to listen, to adapt, to collaborate with stakeholders [in order to] understand what's going to work and what's not going to work in Canada," she said.

## **2023 Code of Practice Refresh**

## 2.3.3 Areas for Sick, Injured, or Lame Cattle

Sick, injured, or lame cattle benefit from being housed in areas that facilitate additional care and treatment and allow them to recuperate without having to compete for feed, water, and lying areas. When ill, cows often separate from herd mates if given the opportunity (21). However, isolation is stressful to cattle, and they should only be segregated when necessary to support their recovery (e.g., prevent injury by herd mates) or minimize transmission of a contagious disease.

Refer also to Section 5.3 – Caring for Sick, Injured, or Compromised Cattle.

#### **REQUIREMENTS**

Areas must be available to segregate, care for, and treat cattle that are sick, injured, or lame.

#### **RECOMMENDED PRACTICES**

- a. design or modify facilities to have dedicated areas exclusively for sick, injured, or lame cattle
- b. ensure sick pens provide enhanced comfort conducive to recovery (e.g., deep bedding or sand, soft rubber mat, supplemental heat, no drafts)
- c. ensure convalescing cattle that need to be segregated have visual contact with other cattle
- d. clean and disinfect sick pens after each use.

# List of Requirements Comparison between 2023 and 2009

| Areas must be available to segregate, care for, and treat cattle that are sick, injured, or lame. | Revised (addition of: lame and care for) |

## **Keep Calves Hydrated in the Heat of Summer**

Dairy farmers know the importance of getting plenty of water to their cows during the hot summer months, but what about your calves? High ambient temperature and humidity can lead to heat stress in calves. In these situations, calf panting, and sweating do not compensate for this stress and calf energy needs will increase which must be supported by adequate nutrition. In addition, as calves attempt to maintain body temperature in the summer months increased respiration and sweating results in water losses which must be replaced. As environmental temperature increases, water intake increases accordingly.

Research indicates that the amount of water needed by nursery calves depends not only on environmental conditions, but on other factors like the incidence of scours and the amount of milk or milk replacer and starter intake. Water intake is closely related to starter intake, but water intake may increase independent of starter intake when temperature is above the Upper Critical Temperature for calves. Research has shown the amount of liquid in milk replacer also affects the amount of water consumed. Water temperature can also affect water intake.

So, what can you do? Keeping your calves hydrated is simple and easy, but it may require a little extra labor during the summer months.

- \* Make sure your calves always have water. If you notice their bucket is empty, fill it! Check calves several times a day to ensure they have water.
- \* Keep the water fresh. The calf may still have half her bucket left, but if it has been sitting all day, has feed in it, or is dirty she may not drink it. Aim to give calves fresh water at least twice a day.
- \* Clean out buckets. Especially if you have a system where grain and water use the same buckets, make sure they all get a thorough cleaning between calves. Residues and germs from other calves can wreak havoc on an already immuno-suppressed calf.

In the summer months, it's important for every animal on your farm to have adequate access to fresh, clean water. Making sure your calves have enough to drink can help prevent issues now and down the road.

- Emily Wilmes, University of Minnesota Extension

## **Indigenous Ambassador Program**

With funding by Dairy Farmers of Canada, SaskMilk has partnered with the University of Regina to further-connect with the First Nations demographic by way of this pilot program.

The Ambassador Program we are developing is designed to achieve two primary objectives:

- \* To deliver nutritional education and enhance awareness of dairy products within First Nations communities across Canada, emphasizing the health benefits of dairy.
- \* To highlight the commitment of our producers and the involvement of Dairy Farmers of Canada in these communities, particularly regarding our sustainable practices.

The framework of the proposed program will also encompass the following components:

- \* Establishing and nurturing relationships with First Nations communities.
- \* Creating tailored nutritional guidelines that integrate local food resources with dairy products for First Nations communities.
- \* Facilitating event activations to engage younger Indigenous consumers.
- \* Promoting education about Dairy Farmers of Canada's sustainability initiatives and the contributions of local dairy farmers.
- \* Enhancing awareness of shelf-stable dairy products and serving as a liaison for resource connectivity.

Charm tests strips and Charm testers are available for purchase through SaskMilk 306-949-6999. Snap tests and supplies are available for purchase through Agrifoods 306-664-0264.

## **Quota Exchange**

The market-clearing price established for the August 2024 Quota Exchange was \$39,325.00.

The next Quota Exchange will be held on **September 15 2024**. All offers to sell and bids to purchase quota through the Quota Exchange must be submitted by midnight, **September 6, 2024**. SaskMilk recommends that offers and bids be submitted well in advance of the deadline date to ensure adequate time for corections, if necessary.

When making bids on the Quota Exchange, the price on offers to sell quota is the minimum price that the producer is prepared to accept for that quota. Only if the market-clearing price is equal to or greater than the producer's minimum price will that producer qualify for participation in the Exchange. Conversely, the price on offers to purchase quota is the maximum price that the producer is prepared to pay for that quota. Only if the market-clearing price is equal to or less than the producer's maximum price will that producer qualify for participation in the Exchange. The clearing price is set at the price where the smallest difference exists between the accumulated volume offered for sale and the accumulated volume bid to purchase. The results of the Quota Exchange are outlined in the following table.

## **AUGUST 2024 QUOTA EXCHANGE RESULTS**

# Providing support when you need it the most, available 24 Hours, Days a week. CALL 1-800-667-4442

Farm Stress Line was initiated and funded by the Ministry of Agriculture in 1992. The Ministry of Agriculture contracted with MCS Inc. in 2012 to administer and provide crisis counselling to rural Saskatchewan. This change provides a 24hr 7 days a week response through a 1-800 toll free phone line with a proven expertise in crisis counselling.

Mobile Crisis Services, Inc. is a non-profit community-based organization that has been providing crisis intervention services to Regina and the province of Saskatchewan since 1974. The overall purpose of the agency is to provide integrated and comprehensive social and health crisis intervention services.

Mobile Crisis Services is governed by a volunteer Board of Directors. These volunteers contribute a significant amount of time to assist in the direction of programs and services for youth, individuals, families and seniors.

Services are provided on a 24-hour, seven day a week basis, in order to assure accessibility regardless of the time of day. The agency was formulated on the philosophy of "where services should be provided, they will be provided." The agency represents an innovative approach to crisis intervention and is an integral part of the health and social service delivery systems. Mobile Crisis Services is committed to community health and the development of supportive communities. For more information, visit:

|  | Jul-24 | 1,054,763                | 1,042,469                             | 12,294                                | -256,017                             |

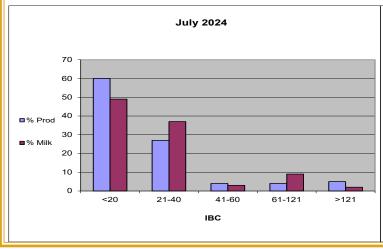

In **July**, Saskatchewan had a monthly CDC allocation of **1,042,469 kgs** of butterfat. Saskatchewan production was **12,294 kgs** of butterfat over and cumulatively over by **1,041,572 kgs** of butterfat. On a percentage basis, Saskatchewan is **8.14%** above our CDC allocation flexibility limits based on the Continuous Quota model. The -2.00% lower flexibility limit is in effect.
